

14 dBm P1dB, 2 GHz to 18 GHz, Gain Block Amplifier, 23 dB Gain, 3.5 dB NF, SMA

PE1524

Features

- 2 GHz to 18 GHz Broadband Frequency Range
- P1dB: 14 dBm typ
- Small Signal Gain: 23 dB typ
- 50 Ohm Input and Output Matched
- Operating Temperature: -30°C to +70°C
- Unconditionally Stable
- Single DC Positive Supply
- Built-In Voltage Regulator

Applications

- Research and Development
- Military Radio
- Radar Systems
- Telecom Infrastructure
- Test Instrumentation
- Military and Space
- Communication Systems
- Wireless Communication
- Microwave Radio Systems
- Cellular Base Stations
- General Purpose Amplification
- Wideband Gain Block

Description

The PE1524 is a broadband general purpose RF coaxial gain block amplifier operating from 2 GHz to 18GHz. Impressive typical performance includes 23 dB small signal gain, 14 dBm output P1dB, and 3.5 dB Noise Figure. The exceptional technical performance is achieved through the use of a hybrid MIC design and advanced GaAs PHEMT devices. This gain block amplifier requires a 12V DC power supply that includes built-in voltage regulation, is unconditionally stable and operates over a temperature range of -30°C to +70°C.

Electrical Specifications

(TA = +25°C, DC Voltage = 12 Volts, DC Current = 120mA)

Description	Minimum	Typical	Maximum	Units
Frequency Range	2		18	GHz
Small Signal Gain	20	23		dB
P1dB	10	14		dBm
Gain Flatness		±1	±1.5	dB
Noise Figure		3.5	4.5	dB
Input VSWR		1.9:1	2.1:1	
Output VSWR		1.9:1	2.1:1	
Operating DC Voltage		12		Volts
Operating DC Current		120	150	mA
Operating Temperature	-30		+70	°C

*OTR= Base Plate Operating Temperature Range

Mechanical Specifications

Size

Length	1.083 in [27.51 mm]
Width	1.093 in [27.76 mm]
Height	0.382 in [9.7 mm]
Weight	0.0767 lbs [34.79 g]

14 dBm P1dB, 2 GHz to 18 GHz, Gain Block
Amplifier, 23 dB Gain, 3.5 dB NF, SMA

PE1524

Input Connector	SMA Female
Output Connector	SMA Female

Environmental Specifications

Temperature Operating Range	-30 to +70 deg C

Amplifier Power-up Precautions

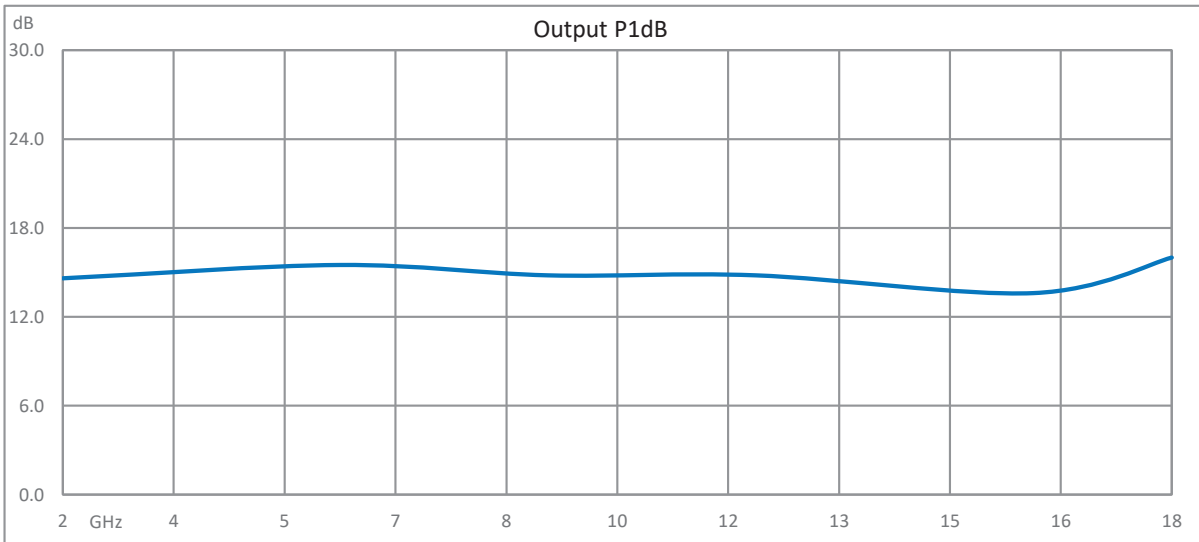

- 1.) Confirm that proper ESD precautions and controls are always in place before handling any Amplifier module.
- 2.) Confirm adequate thermal management is in place to effectively dissipate heat away from the Amplifier package. The Amplifier operational baseplate temperature must be within the operational temperature range stated in the Amplifier datasheet. Depending on the design and thermal requirements, using a heatsink with cooling fan is always recommended for safe reliable operation. A heat sink without a cooling fan may also be used. Damage caused from overheating will void the warranty.
- 3.) Confirm adequate system grounding is established. The DC power supply and Amplifier must have a common ground in order to operate properly.
- 4.) Power Amplifiers may require additional DC Current when initially powered-up. Depending on the design, the input current draw could range from an additional 10% to 100% above the maximum rated DC current of the Amplifier. This varies based on product part number.
- 5.) Confirm the DC power supply, if limited, is set to allow for additional start-up current that's rated for the Power Amplifier.
- 6.) Confirm the system is designed and calibrated for 50 ohms. Any impedance mismatch may cause performance issues.
- 7.) Perform a CALIBRATION (if required) with the loads before connecting the Amplifier to the Network Analyzer to ensure proper performance.
- 8.) Use a fixed attenuator between the signal source and input port of the Amplifier to optimize the input VSWR match.
- 9.) Confirm the input power level at the input port of the amplifier does not exceed the maximum rated limit for input power (as stated in the Amplifier datasheet).
 - P_{in} for Small Signal Gain = P1dB-SSG-10 dB
 - P_{in} for P1dB = P1dB-SSG+1 dB
- 10.) Confirm the Network Analyzer is always connected to the Amplifier first before DC power is applied to the Amplifier.
- 11.) As long as the input and output ports of the amplifier are connected to a 50Ohm load and RF signal power is applied, the Amplifier can be powered up with DC voltage.
- 12.) Confirm the Amplifier output load is matched for a 50 Ohm impedance and will not exceed the maximum rated VSWR or Return Loss limit for the Amplifier. Exceeding the maximum rated VSWR or Return Loss limit will result in reflected signal power that could damage the Amplifier and void the warranty.
- 13.) **Power Amplifier connected to an Antenna for signal transmission** - It's strongly recommended to use a high power fixed attenuator pad or an Isolator between the output port of the Amplifier and input port to the antenna. Any reflected signal power due to impedance mismatch will likely damage the Amplifier and void the warranty.
- 14.) The attenuator or isolator used at the output port of the Amplifier must be rated to handle the output power level and operational frequency band of the amplifier.
